

Customer case study – Asian Online Gambling Site

The Customer

The company has recently established online interactive card game services.

Network Configuration

The network includes Catalyst switches, firewalls and banks of web and game servers. Each server's traffic arrives through only one of the 100Mb internet links.

IntelliGuard DPS deployment

Operating a business that requires uninterrupted service availability and is highly vulnerable to DDoS attacks, the company decided that reliable first rate DDoS protection was mandatory.

After reviewing alternatives, an IntelliGuard DPS 2000 was selected for its proven ability to protect online gambling services, and its unique ability to protect individual servers from sophisticated targeted attacks.

Before the gambling services went live the DPS 2000 automatically discovered the IP addresses of every server in the network and applied individual traffic profiles for each of them.
